

## Description:

This is a pretty good panel optimizer I wrote a few years ago and got too busy doing other things to improve or support. I am offering it as shareware and hoping that people will find it useful.

It is intended for use by small to medium-size cabinet shops. It has features that will appeal to people who do fussy work: for example, you can group a block of doors and drawer faces and constrain their copies to appear in the same relative location across several sequence-matched sheets. It falls on the side of speed and flexibility at the expense of truly optimal results. Though, as I say, it's pretty good in that respect.

If you find it very useful, please send a check for \$50 to the address in the 'about' box. If you find it useful enough to use every once in a while, send \$25.

I offer the program without support or warranty, but will try to answer questions by email.
